Secret Finder

Developers sometimes commit passwords or keys by mistake. Build a CLI tool that finds them in a change.

- **Input:** a git diff (file or stdin), a commit hash, or the current changes in the working directory
- **Output:** a list of findings with file and line, and a short reason for each

Rules

- Start from scratch. CLI only. Use any language, tools, or AI you want.
- Time: about 30 minutes.
- The repo must include a short README (how to run it, where it fails) and 2-3 tests.
- If you used AI, include your prompts or logs.
- Later, we may ask you to explain your work.
